Product Overview

Filex is a self-hosted file manager that gives teams a fast, familiar way to browse, preview, search and share files from any storage backend. It runs as a single service and embeds into existing web applications as a component.

File Storage

Connect local disks, S3-compatible object storage or WebDAV shares and present them as one workspace. Uploads are resumable and large files are streamed without buffering on the server.

Search

Find files by name, type, date or content. Text is extracted from PDF, Office and Markdown documents and indexed incrementally, so results reflect changes within seconds.

Sharing

Create share links with a PIN, an expiry date and a download limit. See who opened a link and revoke it in one click. Internal sharing respects the permissions of the person who shared.

Security

Sessions, API tokens and share links are all scoped and revocable. Two-factor authentication, audit logging and content sniffing protect the workspace against the most common threats.

Integrations

Embed the file browser as a web component, a React component or a Vue component. Automate with the HTTP API, or mount a workspace over WebDAV from any operating system.
